Motivation

This application will allow users, while viewing an area of google maps, to see locations that are registered in the Yelp system. They can then select one of these locations and view Yelp ratings alongside any recent tweets about the location. By doing so one can see places of interest in an area and get rating-based and social-media-based information on these places.

Goal

This application will be web-based and will have an embedded view of Google Maps. Alongside this view there will be a window which will display the list of Yelp-registered locations. There will be some way to select one of these locations and open a new view which combines Yelp reviews and recent tweets about the location.

Design

We will use the Google Maps API along with the Yelp and Twitter APIs in order to create this mashup.
